Mechanized reactivation

The factory was originally arranged in one gravity in order to lighten the productivity process. With the introduction of a new program, new responsibility needs are required to satisfy such industrial spaces. Two machinery and a warehouse have been removed in key points of the central area of the factory to maximize the site and provide new experiences for the user. Like in a new context, the intersection of a specific space operates the heating of the site. The intervention provides a sequence of existing central industrial-mechanical spaces, old with minimum interventions, and new machinery. After the interventions, the factory becomes completely reconfigurable.
