

Acknowledgments

This research, carried out in the Faculty of Civil Engineering and Geosciences of Delft University of Technology, would not have been possible without the help and support of many people.

First of all I wish to express my sincere gratitude to Garth Wells for the confidence he showed me when he proposed me this study. His guidance in planning, conducting and writing this thesis is highly appreciated as well. I also want to thank Nguyen Tien Dung for his advice and guidance in discontinuous Galerkin methods; without him, many of the results obtained in this work would have not been possible. Thanks as well to Bert Sluys for his corrections and suggestions and to Miguel Gutiérrez for taking part in this project.

I also want to thank the roommates and colleagues at the Department of Structural Mechanics for their help and friendship throughout this year. Thanks to Adriaan Pfeiffer with whom I had long discussions on the topic, thanks to Marteen Booij, May, Oriol Lloberas, Ronnie Pedersen, Wendie Swolfs and Xie Yie.

I also want to express my gratitude to the UNITECH program for offering me the opportunity to come to TU Delft as an exchange student for a year, which opened my way to this Master of Science. Special thanks to the local TU Delft coordinator Ineke de Bruin, for her kindness throughout my stay in Delft.

Finally I wish to acknowledge Dr. Antonio Rodriguez from the Polytechnic University of Catalonia (UPC) for making this exchange possible. Although he did not personally know me; he accepted not only being part of this work, but also being my supervisor at the UPC.

Diego Romagosa
Delft, June 2005
