List of figures

1. 4 Evolution of the steel price compared to other goods and services, Stevens (2000) after Valls (2002) ........................................................................ 14
1. 6 Electric installation in the wall panels, Consul Steel (2003) after Valls (2002) ............................................................................................................. 15
3. 1 Accelerogram registered during the Ardal earthquake (6/4/1977), Internet-Site for European Strong-Motion Data (2001) .............................................. 31
3. 2 Example of a set of response spectrum curves in a trilogarithmic graphic, Clough (1975) ......................................................................................... 34
3. 3 Comparison of $\rho_{nm}$ for two different types of excitations, Der Kiureghian (1980) ........................................................................................................ 38
4. 1 Orientation of the cantilever ................................................................................ 40
4. 2 Deformed shape of the: 2nd eigenmode (flexion around the weak axis $f = 8.1195$ Hz), 5th eigenmode (flexion around the strong axis $f = 20.749$ Hz) and 19th eigenmode (flexion around the weak axis $f = 129.41$ Hz) .................. 41
4. 3 Evolution of the eigenfrequencies due to the variation of steel density ........... 43
4. 4 Comparison of the numerical and analytical results of the lowest eigenfrequency ................................................................................................. 44
4. 5 Evolution of the eigenfrequencies due to the variation of stiffness .............. 45
List of figures

4. 6 Flexural eigenfrequencies evolution due to stiffness variation ....................... 46
4. 7 Torsional eigenfrequencies evolution due to stiffness variation ..................... 46
4. 8 Displacement – stiffness relationship applying the triangular
   accelerogram ................................................................................................... 47
4. 9 Displacement – stiffness relationship applying the triangular
   accelerogram ................................................................................................... 48
4.10 Zoom on the displacement – stiffness relationship ...................................... 49
4.11 Maximum acceleration – stiffness relationship for the triangular
   accelerogram ................................................................................................... 49
4.12 Horizontal reaction – stiffness relationship applying the triangular
   accelerogram ................................................................................................... 50
4.13 Moment reaction – stiffness relationship applying the triangular
   accelerogram ................................................................................................... 50
4.14 Linear behaviour of the analysis .................................................................. 52
5. 1 Four methods for the horizontal stabilization of the frame. 1.- Clamped
   columns, hinged threshold. 2.- Hinged columns, fixed threshold. 3.- Fixed
   columns and threshold. 4.- Hinged columns, threshold and the bracing
   diagonal ........................................................................................................... 54
5. 2 First eigenmode of vibration of the frame with fixed columns and hinged
   joints, \( f = 13.514 \text{ Hz} \) .............................................................................. 56
5. 3 First eigenmode of vibration of the frame with hinged columns and fixed
   joints, \( f = 9.9869 \text{ Hz} \) .............................................................................. 56
5. 4 First eigenmode of vibration of the frame with fixed columns and joints,
   \( f = 22.089 \text{ Hz} \) ....................................................................................... 57
5. 5 Second eigenmode of vibration of the frame with a bracing diagonal,
   \( f = 45.034 \text{ Hz} \) ....................................................................................... 57
5. 6 First vibration mode of the frame with a bracing diagonal, \( f = 16.927 \text{ Hz} \) .... 58
5. 7 Deformed shape of the frame with one diagonal when the Eurocode
   load is applied. The scale factor for the displacements is 1000 ...................... 58
5. 8 Evolution of the horizontal displacement due to the variation of the modal
   damping ratios, the Eurocode seismic load is applied ................................. 60
5. 9 Scheme of the roof to calculate the mass beared by each frame ................. 62
5.10 First eigenmode of the x-braced frame considering the roof weight,
   \( f = 6.5359 \text{ Hz} \) ....................................................................................... 63
List of figures

5.11 Deformed shape of the x-braced frame considering the roof weight when the Eurocode load is applied. The scale factor for the displacements is 100 .......................................................... 64

5.12 Configuration of the different bracing units being analysed. 1.- 1 diagonal, hinged columns. 2.- 1 diagonal, clamped columns. 3.- 2 joined diagonals, hinged columns. 4.- 1 diagonal joined to the centre column, hinged columns 5.- 2 diagonals joined to the centre column, hinged columns. 6.- 2 diagonals not joined, hinged columns ........................................ 65

5.13 First eigenmode for configuration 1 and a width of 100 mm.,
\[ f = 7.5137 \text{ Hz} \] ........................................................................................................ 66

5.14 First eigenmode for configuration 2 and a width of 65 mm.,
\[ f = 6.6521 \text{ Hz} \] .................................................................................................. 67

5.15 First eigenmode for configuration 4 and a width of 65 mm.,
\[ f = 6.5894 \text{ Hz} \] .................................................................................................. 68

5.16 First eigenmode for configuration 3 and a width of 65 mm.,
\[ f = 9.2617 \text{ Hz} \] .................................................................................................. 69

5.17 Scheme of the variables calculated in the structural analysis .............. 70

6.1 Five configurations of the façade to be analysed. 1.- Clamped columns, no diagonal. 2.- Clamped columns, diagonal at the extreme frame. 3.- Hinged columns, diagonal at the extreme frame. 4.- Hinged columns, diagonal at the centre frame. 5.- Clamped columns, diagonal at the centre frame .......... 74

6.2 First eigenmode of vibration for the façade with hinged joints and columns, configuration 4, \[ f = 3.0249 \text{ Hz} \] .......................................................... 74

6.3 Deformed shape of the frame corresponding to configuration 4 when applying the Eurocode response spectrum. The scale factor for the displacements is 10 ............................................................................. 76

6.4 Evolution of the axial force along the threshold for a façade with hinged columns, configuration 3 .......................................................... 77

6.5 Evolution of the axial force along the threshold for a façade with fixed columns, configuration 2 .......................................................... 78

6.6 Schematic comparison of the axial force along the threshold .............. 78

6.7 Variation of the axial force along the threshold due to the position of the diagonal strap, it corresponds to configurations 3 and 4 .................................. 79

6.8 Configuration of the façades with openings ........................................ 80
List of figures

7.  1 Drawing of the 3D structure consisting in four façades ......................... 83
7.  2 First eigenmode for the 3D structure consisting in four façades,
    \( f = 5.48333 \times 10^{-2} \text{ Hz} \) ................................................................. 84
7.  3 Second eigenmode for the 3D structure consisting in four façades,
    \( f = 0.21908 \text{ Hz} \) .................................................................................. 84
7.  4 Drawing of the 3D structure consisting in four façades and roof trusses ...... 85
7.  5 First eigenmode for the 3D structure with stiffeners, \( f = 0.35569 \text{ Hz} \) ......... 86
7.  6 Second eigenmode for the 3D structure with stiffeners, \( f = 0.39136 \text{ Hz} \) ...... 86
7.  7 Drawing of the 3D structure including the roof ....................................... 87
7.  8 First eigenmode for the 3D structure with the roof and diagonals of
    150 mm width, \( f = 1.3878 \text{ Hz} \) ................................................................. 88
7.  9 Second eigenmode for the 3D structure with the roof and diagonals of
    150 mm width, \( f = 1.3881 \text{ Hz} \) ................................................................. 89
7.10 Fourth eigenmode for the 3D structure with the roof and diagonals of
    150 mm width, \( f = 2.4040 \text{ Hz} \) ................................................................. 89
7.11 Tributary areas for the uniform wind load ................................................ 90
7.12 Punctual wind loads acting on the structure .............................................. 91
7.13 Horizontal eigenmode of vibration for the structure with two braced frames
    per façade, \( f = 2.4934 \text{ Hz} \) ......................................................................... 93
7.14 Drawing of the 3D structure with 4 diagonals per façade ............................ 94
7.15 Scheme of the joint of two diagonals to the column .................................. 95
7.16 Direction of the forces acting on the roof .................................................. 96
7.17 Evolution of the acceleration applied on the roof ....................................... 96
7.18 Evolution of the horizontal displacements: \( u_x \) and \( u_y \) ............................ 97
7.19 Sketch of the trajectory in the x-y plane of a point in the roof .................... 98
7.20 Maximum displacement of the roof in the x-direction. The scale factor for
    the displacements is 10 .................................................................................. 98
7.21 Maximum displacement of the roof in the y-direction. The scale factor for
    the displacements is 10 .................................................................................. 99
A.  1 Triangular accelerogram ......................................................................... I
A.  2 Response spectrum evaluated from 1 to 50 Hz and damping ratios 2, 5, 10,
    15 and 20% ............................................................................................ II
A.  3 Horizontal peak ground acceleration in Europe, 10% probability of
    exceedance in 50 years, GSHAP (1999) .................................................... III
List of figures

A. 4 Design response spectrum for 2, 5, 10 and 20% damping ratios ..................IV
A. 5 Accelerogram registered during the Ardal earthquake (6/4/1977),
    Internet-Site for European Strong-Motion Data (2001) ..............................V
A. 6 Response spectrum for the Ardal earthquake and 2, 5, 10 and 20%
    damping ratios ........................................................................................................V
