

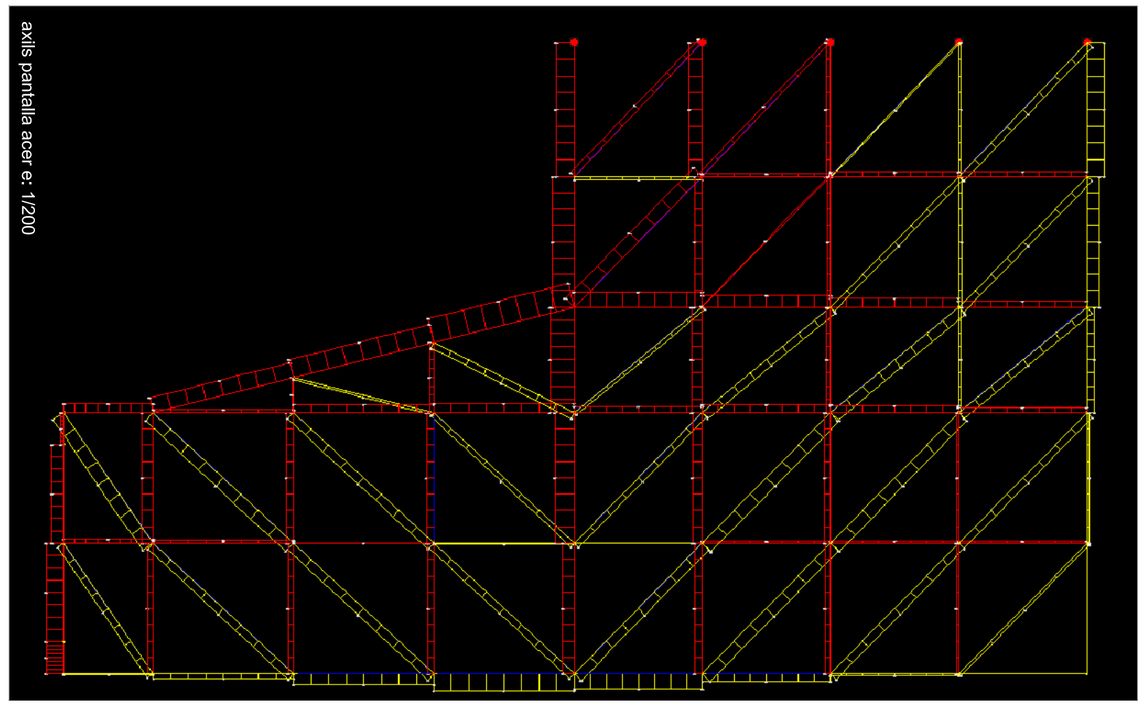
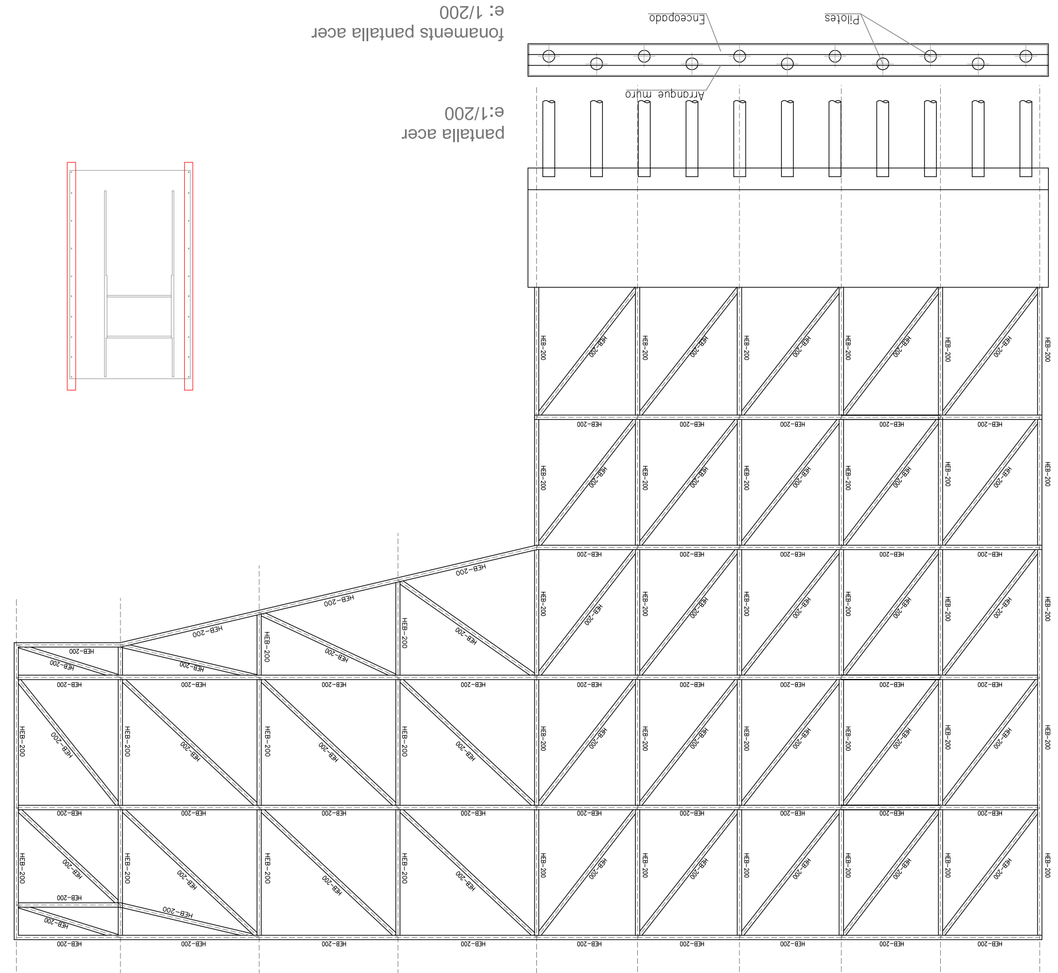
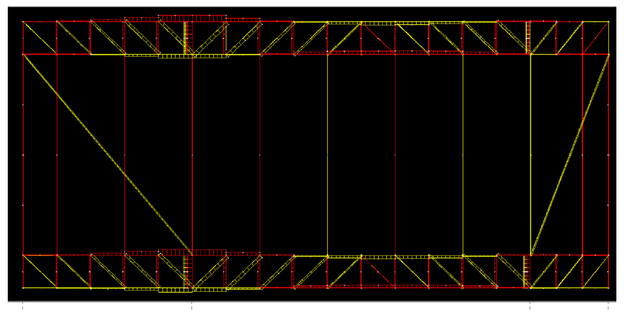
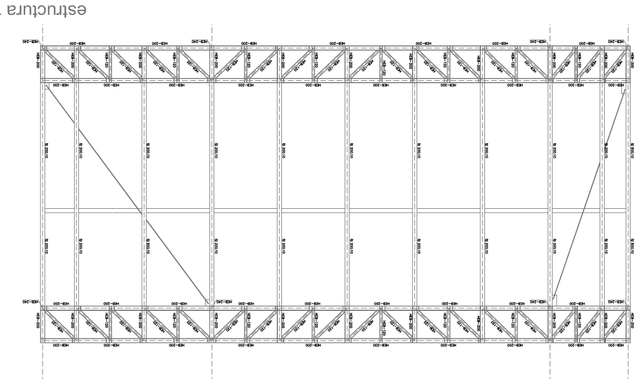
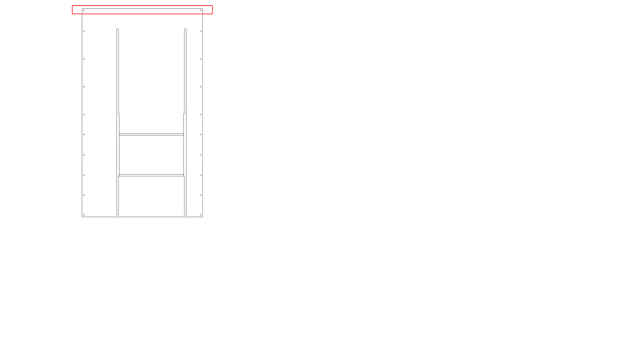
La pantalla d'acer està sol.licitada al moment lateralment (vent). Es per això que'ls ha deformacions en el pla horitzontal. Les deformacions en el pla vertical estan despreciables perque hem previst diagonals que milloren el comportament de la estructura lateral.











Aquesta esquema explica el principi de funcionament de la parte frontal del voladiz: cuan la cercha inferior es deforma, el pes sera mes gran la deformacio sera important y es per aixo que es collocan les cables que ajudaran sujetar les puntes del vol.
