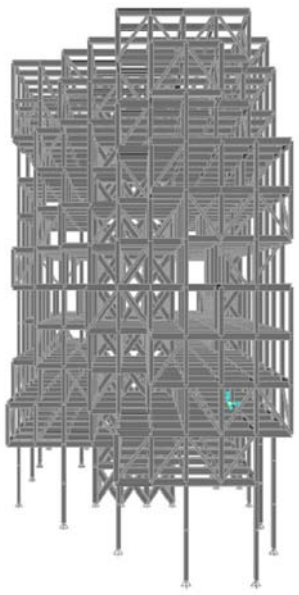
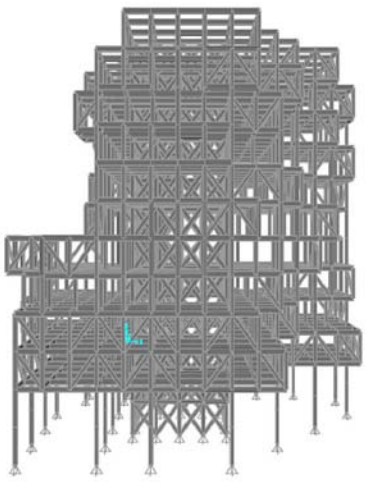
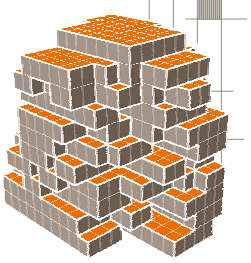
CONCLUSIONS CÀLCULS






Els càlculs s'han fet de la torre, que és l'element més complex de l'estructura de tot l'edifici.
La deformació més desfavorale és més aviat petita, és un valor molt correcte per les llums màximes existents, això és degut a l'efecte de treballar bidireccionalment amb una estructura recolçada en tot el perimetre i trabada amb uns nuclis estructurals que reben la resta de descàrregues. Si fos unidireccional segurament tindriem valors de deformació més de quatre vegades majors.
