

## Greetings

Antoni Giró Roca

*Rector of the Technical University of Catalonia*

After last year's celebration of the tenth anniversary of the UNESCO Sustainability Chair—a year full of events, including the First International Conference on Sustainability Measurement and Modelling—we are pleased to present the ninth edition of the annual monographic publication *Sostenible?*, which aims to contribute to critical, rigorous promotion of sustainability from an interdisciplinary perspective. It is addressed to all those members of the public interested in the topic.

This year, having dealt with the hot topic of energy in the previous issue, the journal turns to the more theoretical topic of the paradigm of complexity and its relationship with sustainability. Despite its theoretical nature this is a topic that has important practical repercussions, because it determines the way problems should be tackled and thus how appropriate solutions should be found.

As in the case of previous issues, articles were entrusted to several of the Chair's lecturers and collaborators, thereby profiting from their expertise in the field and from the experience acquired throughout the ten years of the Chair's existence. Moreover, this issue is made particularly special by the contribution of someone who is surely the most relevant figure in the field of complex thought, Edgar Morin. His prolific output has contributed indisputably to promoting the field.

It is our hope that in reading the articles those not already acquainted with the topic, and those who are, will gain in their understanding of this paradigm and its unquestionable contribution to solving the problems of unsustainability in the world today.
