Abstract: Overlapping decentralized linear quadratic control design problem for discrete–time time–varying systems is solved by using generalized selection of complementary matrices. Explicit conditions on the structure of complementary matrices are derived, including conditions on contractability of controllers. Systematic procedure for their selection is given.

Keywords: Decentralized control, large-scale systems, linear systems, discrete–time systems, time–varying systems, overlapping decompositions, optimal control.

1. INTRODUCTION

The inclusion principle has been developed by Siljak and his co-workers (Ikeda et al. 1981), (Ikeda et al. 1984a), (Siljak 1991). It defines a framework for two dynamic systems with different dimensions, in which solutions of the system with larger dimension includes solutions of the system with smaller dimension. The conditions on complementary matrices, which are presented there, have implicit character in the sense that it is difficult to select their specific values. In fact only two particular forms of aggregations and restrictions have been used for the control design and numerical computations. Recently, a generalized procedure for selection of complementary matrices has been developed as a mean to overcome this drawback (Bakule et al. 2000a), (Bakule et al. 2000b), (Rossell 1998). However, these results concern continuous–time linear time invariant (LTI) systems. The only results for linear time–varying (LTV) systems are given in (Ikeda et al. 1984b). Concerning discrete–time LTI systems, only multirate control systems have been considered in (Ito 1998) because the extension from continuous–time LTI systems to its discrete–time single rate counterpart is straightforward. However, this extension is not straightforward when considering LTV systems within the inclusion principle.

In this paper, it is shown how to extend the strategy of generalized selection of complementary matrices for the decentralized linear quadratic optimal control design of discrete–time LTV systems.
2. PROBLEM FORMULATION

Consider the optimal control problems as follows:

$$\min_{u(k)} J(x(k_o), u(k)) = x^T(k_o)P(x(k_o)) + \sum_{k=k_0}^{k-1} \left[ x^T(k)Q^*(k)x(k) + u^T(k)R^*(k)u(k) \right],$$

s.t. $S : x(k+1) = A(k)x(k) + B(k)u(k)$

and

$$\min_{\tilde{u}(k)} J(\tilde{x}(k_o), \tilde{u}(k)) = \tilde{x}^T(k_o)\Pi \tilde{x}(k_o) + \sum_{k=k_0}^{k-1} \left[ \tilde{x}^T(k)Q^*(k)\tilde{x}(k) + \tilde{u}^T(k)R^*(k)\tilde{u}(k) \right],$$

s.t. $\tilde{S} : \tilde{x}(k+1) = \tilde{A}(k)\tilde{x}(k) + \tilde{B}(k)\tilde{u}(k)$

where $k_o$ is the initial time, $k_f$ is the final time and integers $k \in \{k_0, k_0 + 1, ..., k_f\}$. The vectors $x(k) \in \mathbb{R}^n$, $u(k) \in \mathbb{R}^m$ and $\tilde{x}(k) \in \mathbb{R}^\tilde{n}$ are the states and inputs of $S$ and $\tilde{S}$ at time $k$ for $k \in \{k_o, k_f\}$, respectively. $A(k)$, $B(k)$, $Q^*(k)$, $R^*(k)$ and $\tilde{A}(k)$, $\tilde{B}(k)$, $\tilde{Q}^*(k)$, $\tilde{R}^*(k)$ are matrices of appropriate dimensions satisfying standard assumptions on the LQ design. Suppose $n \leq \tilde{n}$. $x(k) = x(x(k_o), u(k)), \tilde{x}(k) = \tilde{x}(\tilde{x}(k_o), \tilde{u}(k))$ denote the solutions of (1), (2) for given inputs $u(k), \tilde{u}(k)$, respectively. Given an initial time $k_o$, an initial state $x(k_o)$ and an input signal $u(k)$ defined for all $k \in \{k_o, k_f\}$, it is well known that

$$x(k) = \Phi(k, k_o) x(k_o) + \sum_{j=k_o}^{k-1} \Phi(k, j+1)B(j)u(j),$$

$$\tilde{x}(k) = \tilde{\Phi}(k, k_o) \tilde{x}(k_o) + \sum_{j=k_o}^{k-1} \tilde{\Phi}(k, j+1)\tilde{B}(j)\tilde{u}(j)$$

are the unique solutions of the systems (1) and (2), respectively. $\Phi$, $\tilde{\Phi}$ are discrete-time transition matrices (Rugh 1996). Suppose the sum is zero if $k = k_o$. Specifically, and only for the ordering of arguments corresponding to forward iteration, let us denote

$$\Phi(k, j) = A(k-1)A(k-2)\cdots A(j), \quad j \geq k$$

by adopting the convention that an empty product is the identity, i.e. $\Phi(k, j) = I$ if $k = j$.

$S$ and $\tilde{S}$ are related by the transformations $\tilde{x}(k) = Vx(k), \tilde{z}(k) = U\tilde{x}(k), \tilde{u}(k) = RU(k), u(k) = Q\tilde{u}(k)$, where $V, U, R$ and $Q$ are constant full-rank matrices of appropriate dimensions.

Definition 1. We say that a pair $(S, \tilde{S})$ includes a pair $(S, \tilde{S})$, that is $(S, \tilde{S}) \supset (S, \tilde{S})$, if there exist a quadruplet of constant matrices $(U, V, Q, R)$ such that $UV = Im, QR = f_m$ and for any initial state $x(k_o)$ and any fixed $u(k)$ of $S$, $x(k; x(k_o), u(k)) = Ux(k_o) + \sum_{j=k_o}^{k-1} \Phi(k, j+1)B(j)u(j)$ for all $k \in \{k_o, k_f\}$; and $J(x(k_o), u(k)) = J(Vx(k_o), Ru(k))$.

Definition 2. If $(\tilde{S}, \tilde{J}) \supset (S, J)$, then $(\tilde{S}, \tilde{J})$ is called an expansion of $(S, J)$ and $(S, J)$ is a contraction of $(\tilde{S}, \tilde{J})$.

Definition 3. A control law $\tilde{u}(k) = -\tilde{K}(k)\tilde{x}(k)$ for $\tilde{S}$ is contractible to the control law $u(k) = -K(k)x(k)$ for $S$ if the choice $\tilde{x}(k_o) = Vx(k_o)$ and $\tilde{u}(k) = Ru(k)$ implies $K(k)x(k; x(k_o), u(k)) = \tilde{Q}(k)\tilde{x}(k_o; Vx(k_o), Ru(k))$ for all $k \in \{k_o, k_f\}$, any initial state $x(k_o)$ and any fixed input $u(k)$ of $S$.

Suppose given pairs of matrices $(U, V)$ and $(Q, R)$. Then the matrices $\tilde{A}(k)$, $\tilde{B}(k)$, $\Pi$, $\tilde{Q}^*(k)$, $\tilde{R}^*(k)$ and $\tilde{K}(k)$ can be described as

$$\tilde{A}(k) = V A(k) U + M(k),$$
$$\tilde{B}(k) = V B(k) Q + N(k),$$
$$\Pi = U^T \Pi^{\top} + M_{\Pi},$$
$$\tilde{Q}^*(k) = U^T \tilde{Q}^*(k) U + M_{Q^*}(k),$$
$$\tilde{R}^*(k) = Q^T R^*(k) Q + N_{R^*}(k),$$
$$\tilde{K}(k) = R K(k) U + F(k),$$

where $M(k), N(k), M_{\Pi}, M_{Q^*}(k), N_{R^*}(k)$ and $F(k)$ are complementary matrices.

The problem. The specific goals are as follows: (i) To derive explicit conditions on complementary matrices satisfying $(\tilde{S}, \tilde{J}) \supset (S, J)$ for discrete LTV systems including contractibility conditions; (ii) To present a systematic procedure for their selection.

3. MAIN RESULTS

Agreement: Straightforward proofs are omitted.

Theorem 4. Consider $S$, $\tilde{S}$ given by (1), (2), respectively. $S \supset \tilde{S}$ if and only if

$$U \left[ \Phi(k, k_o) \tilde{x}(k_o) + \sum_{j=k_o}^{k-1} \Phi(k, j+1)\tilde{B}(j)\tilde{u}(j) \right] = \Phi(k, k_o) x(k_o) + \sum_{j=k_o}^{k-1} \Phi(k, j+1)B(j)u(j)$$

for all $k \in \{k_o, k_f\}$.

We must impose some conditions on complementary matrices by (3) to satisfy $(\tilde{S}, \tilde{J}) \supset (S, J)$.

Define for integers $r, s \in \{k_o, k_f\}$ and any square matrix $M$ the matrix product $M[r, s]$ as follows:

$$M[r, s] = M[r] M[r-1] \cdots M(s), \quad r > s$$
$$M[r, s] = M(s), \quad r = s.$$
\( M[r, s] \) is undefined for \( r < s \). Now, we are ready to formulate the inclusion principle for discrete-time LTV systems in terms of complementary matrices.

**Theorem 5.** Consider (1) and (2). \( (S, J) \supseteq (S, J) \) if and only if
\[
UM[r, s]V = 0, \quad UN[r]R = 0, \\
UM[p, q]N(q - 1)R = 0, \quad V^TM_1V = 0, \\
V^TM_2V = 0, \quad R^TM_R (k)R = 0
\]
hold for all fixed \( k \in [k_0, k_1] \), for all \( r, s \) such that \( k_0 < s < r < k - 1 \) and all \( p_q \) such that \( k_0 + 1 < q < p < k - 1 \).

**Proof.** By using Definition 1 and Theorem 4, we get: 1) \( U\Phi(k, k_0)z(x(k_0)) = \Phi(k, k_0)z(x(k_0)) \) and further 2) \( \sum_{j=k_0}^{k-1} U\Phi(k, j + 1)B(j)u(j) = \sum_{j=k_0}^{k-1} \Phi(k, j + 1)B(j)u(j) \) for all \( k \in [k_0, k_1] \). If \( k = k_0 \), then 1) holds. Directly by using (5), for all fixed \( k \in [k_0, k_1] \), we obtain \( U\Phi(k, s)V = 0 \) for all \( r \) such that \( k_0 < s < r < k - 1 \). By using (5) and from 1) for all fixed \( k \in [k_0, k_1] \), we get \( U\Phi(k, s)V = 0 \) for all \( r \) such that \( k_0 < s < r < k - 1 \). The remaining conditions can be obtained easily when considering \( J(x(k_0), u(k)) = J(Vx(k_0), Ru(k)) \). \( \square \)

The following theorems give the conditions on complementary matrices to satisfy Definition 3.

**Theorem 6.** A control law \( \tilde{u}(k) = -\tilde{K}(k)\tilde{z}(k) \) for \( S \) is contractible to the control law \( u(k) = -K(k)z(k) \) for \( S \) if and only if
\[
QF(k)\tilde{\Phi}(k, k_0)z(x(k_0)) + \\
+ \sum_{j=k_0}^{k-1} \Phi(k, j + 1) + B(j)\tilde{u}(j) = 0
\]
hold for all fixed \( k \in [k_0, k_1] \).

**Theorem 7.** A control law \( \tilde{u}(k) = -\tilde{K}(k)\tilde{z}(k) \) for \( S \) is contractible to the control law \( u(k) = -K(k)z(k) \) for \( S \) if
\[
QF(k)V = 0, \\
\sum_{j=k_0}^{k-1} K(k, j + 1)V = 0, \\
QF(k)\Phi(k, k_0)z(x(k_0)) + \\
+ \sum_{j=k_0}^{k-1} \Phi(k, j + 1) + B(j)\tilde{u}(j) = 0
\]
hold for all fixed \( k \in [k_0, k_1] \) and all \( p \in [k_0 + 1, k - 1] \).

**Proof.** By using (5), for all fixed \( k \in [k_0, k_1] \), we get: 1) \( QF(k)\tilde{\Phi}(k, k_0)z(x(k_0)) + \\
+ \sum_{j=k_0}^{k-1} \Phi(k, j + 1) + B(j)\tilde{u}(j) = 0 \) and 2) \( QF(k)\Phi(k, k_0)z(x(k_0)) + \\
+ \sum_{j=k_0}^{k-1} \Phi(k, j + 1) + B(j)u(j) = 0 \) for all \( k \in [k_0, k_1] \).

**3.1 Expansion-contraction process**

**Change of basis.** The change of basis in the expansion-contraction process introduced in (Ikeda et al. 1984a, Siljak 1991) represents \( S \) in a canonical form. Since the inclusion principle does not depend on the specific basis used in the state, input and output spaces, we may introduce convenient changes of basis in \( S \) for a prespecified purpose (Bakule et al. 2000b), (Rossell 1998). The expansion-contraction process between \( S \) and \( \tilde{S} \) can be illustrated in the form
\[
S \rightarrow \tilde{S} \rightarrow \tilde{S} \rightarrow \tilde{S}, \quad R^n \rightarrow R^n, \quad V^T U \rightarrow V^T U, \quad R^n \rightarrow R^n, \quad T^1 R^1 \rightarrow T^2 R^2 \rightarrow \ldots \rightarrow T^n R^n \rightarrow R^n, \quad Q \rightarrow Q, \quad R^n \rightarrow R^n, \quad \text{(11)}
\]
where \( \tilde{S} \) denotes the expanded system in a new basis. Given \( V \) and \( R \), we define \( U = (V^T V)^{-1}V^T Q = (R^T R)^{-1}R^T \) as their pseudoinverses, respectively. Let us consider
\[
T_n = (V W_n), \quad T_n = (R W_n), \quad \text{(12)}
\]
where \( W_n \) and \( W_n \) are chosen such that \( \text{Im} W_n = \ker U \), \( \text{Im} W_n = \ker Q \). By using these transformations, the conditions \( \tilde{U}V = I_n, \tilde{U}Q = I_m \) can be easily verified, where \( \tilde{V} = T_n^2 V = T_n \), \( \tilde{U} = T_n U = T_n \), and \( \tilde{R} = T_n^2 R^1 = T_n R^2 \), \( \tilde{Q} = QT_n \). Note that the motivating factor for defining \( T_n \) and \( T_n \) by (12) is the fulfillment of these conditions. They play a crucial role in deriving explicit block structured complementary matrices (with zero blocks) including a general strategy for their selection.

**Expansion-contraction in the new basis.** Consider the system \( S \) partitioned as follows:
\[
\begin{pmatrix}
x_{1}(k+1) \\
x_{2}(k+1) \\
x_{3}(k+1)
\end{pmatrix} = \begin{pmatrix}
A_{11}(k) & A_{12}(k) & A_{13}(k) \\
A_{21}(k) & A_{22}(k) & A_{23}(k) \\
A_{31}(k) & A_{32}(k) & A_{33}(k)
\end{pmatrix} \begin{pmatrix}
x_{1}(k) \\
x_{2}(k) \\
x_{3}(k)
\end{pmatrix} + \begin{pmatrix}
B_{11}(k) \\
B_{12}(k) \\
B_{13}(k)
\end{pmatrix} \begin{pmatrix}
u_{1}(k) \\
u_{2}(k) \\
u_{3}(k)
\end{pmatrix}
\]
\[
\begin{pmatrix}
x_{1}(k) \\
x_{2}(k) \\
x_{3}(k)
\end{pmatrix} = \begin{pmatrix}
A_{11}(k) & A_{12}(k) & A_{13}(k) \\
A_{21}(k) & A_{22}(k) & A_{23}(k) \\
A_{31}(k) & A_{32}(k) & A_{33}(k)
\end{pmatrix} \begin{pmatrix}
x_{1}(k) \\
x_{2}(k) \\
x_{3}(k)
\end{pmatrix} + \begin{pmatrix}
B_{11}(k) \\
B_{12}(k) \\
B_{13}(k)
\end{pmatrix} \begin{pmatrix}
u_{1}(k) \\
u_{2}(k) \\
u_{3}(k)
\end{pmatrix}
\]
where \( A_{1i}(k), B_{1i}(k), i = 1, 2, 3, \) are \( n_i \times n_i, n_i \times n_i \) matrices, respectively. This structure has been

Define $\tilde{S}$ as follows:

$$
\begin{align*}
\min \tilde{J}(\tilde{x}(k), \tilde{u}(k)) &= \tilde{x}^T(k_j) \tilde{P} \tilde{x}(k_j) + \\
&+ \sum_{k=k_0}^{k_j} [\tilde{x}^T(k) \tilde{Q}(k) \tilde{x}(k) + \tilde{u}^T(k) \tilde{R}(k) \tilde{u}(k)],
\end{align*}
$$

such that $\tilde{S} : \tilde{x}(k+1) = \tilde{A}(k) \tilde{x}(k) + \tilde{B}(k) \tilde{u}(k)$ \hspace{1cm} (14)

for all $k \in [k_0, k_f]$, where $\tilde{A}(k), \tilde{B}(k), \tilde{P}, \tilde{Q}(k)$, and $\tilde{R}(k)$ are matrices of appropriate dimensions. The vectors $\tilde{x}(k)$ and $\tilde{u}(k)$ are defined as $\tilde{x}(k) = T_x^{-1} x(k) = \tilde{V} x(k), \tilde{u}(k) = T_u^{-1} u(k) = \tilde{R} u(k)$.

Now, the relations between $\tilde{S}$ and $\tilde{S}$ are defined as $\tilde{A}(k) = V A(k) \tilde{U} + M(k), \tilde{B}(k) = V B(k) \tilde{Q} + \tilde{N}(k), \tilde{P} = \tilde{U} T \tilde{U} + \tilde{M}_P, \tilde{Q}(k) = \tilde{U} T \tilde{Q}(k) \tilde{U} + M_Q(k), \tilde{R}(k) = \tilde{Q} T \tilde{R}(k) \tilde{Q} + \tilde{N}_R(k)$, where new complementary matrices are

$$
\begin{align*}
M(k) &= T_x^{-1} M(k) T_u, \\
N(k) &= T_u^{-1} N(k) T_u, \\
\tilde{M}_P &= T_u^{-1} \tilde{M}_P T_u, \\
\tilde{M}_Q &= \tilde{T}_x T \tilde{M}_Q T_u, \\
\tilde{N}_R &= \tilde{T}_x T \tilde{N}_R T_u. \\
\end{align*}
$$

First, we analyze the structure of the matrices $M(k), N(k), \tilde{M}_P, \tilde{M}_Q, \tilde{N}_R, \tilde{N}_R$, and $N(k)$ in the expanded system. Consider the complementary matrices of $\tilde{S}$ in the form $M_1 = M_1(k), N_1 = N_1(k), \tilde{M}_P = \tilde{M}_P(k), \tilde{M}_Q = \tilde{M}_Q(k), \tilde{N}_R = \tilde{N}_R(k)$, and each matrix dimensions correspond to (13). Consider the matrices $M(k) = (M(k), \tilde{M}_P, \tilde{M}_Q, \tilde{N}_R, \tilde{N}_R)$ are $n \times n, n_2 \times n_2, n_2 \times n_2, n_2 \times n_2$, matrices, respectively. $N_1(k), \tilde{N}_2(k)$ are $n \times m, n_2 \times n_2$ matrices, respectively. $\tilde{M}_P, \tilde{M}_Q, \tilde{N}_R, \tilde{N}_R$ are $n \times n, n_2 \times n_2, n_2 \times n_2, n_2 \times n_2$ matrices, respectively. $N_1(k), \tilde{N}_2(k)$ are $n \times n, n_2 \times n_2$, matrices, respectively. We need to know the form of these submatrices. This is presented by the following propositions.

**Proposition 8.** Consider $S$ and $\tilde{S}$ given by (1) and (14) satisfying $\tilde{S} \subseteq S$, respectively. Then $M(r) = \begin{pmatrix} 0 & M_{12}(r) \\ M_{21}(r) & M_{22}(r) \end{pmatrix}$, where $0$ denotes a null matrix of order $n$ and the other blocks satisfy $M_{12}(p) M_{21}(p-1) = 0$ and $M_{12}(p) M_{22}(p-1, j) M_{21}(j-1) = 0$ for all fixed $k \in [k_0, k_j]$, all $r \in [k_0, k_0-1]$, all $p \in [k_0 + 1, k_1 - 1]$ and all $j \in [k_0 + 1, p - 1]$.

**Proof.** Denote $\tilde{M}(k) = \begin{pmatrix} M_{11}(k) & M_{12}(k) \\ M_{21}(k) & M_{22}(k) \end{pmatrix}$. Consider the condition $\tilde{U} \tilde{M}(r) \tilde{V} = 0$, for $k_0 \leq s \leq r \leq k_1$ given by Theorem 5. $\tilde{U} \tilde{M}(k_0, k_1) \tilde{V} = 0$ implies $M_{11}(k_0) = 0$ for $k = k_0 + 1$. We obtain $M_{11}(k_0) = 0, M_{12}(k_0 + 1) = 0$ and $M_{12}(k_1, k_0 + 1) = 0$ for $k = k_0 + 2$. We get $M_{12}(r) = 0$ together with the conditions $M_{12}(p) M_{21}(p-1, j) M_{21}(j-1) = 0$ for all $r \in [k_0, k_j]$, all $p \in [k_0 + 1, k_1 - 1]$ and all $j \in [k_0 + 1, p - 1]$ when repeating this process. □

**Proposition 9.** Consider $S$ and $\tilde{S}$ given by (1) and (14) satisfying $\tilde{S} \subseteq S$, respectively. Then $\tilde{N}(r) = \begin{pmatrix} 0 & N_{12}(r) \\ N_{21}(r) & N_{22}(r) \end{pmatrix}$, where $0$ is an $n \times n$ matrix and the other blocks satisfy $M_{12}(p) N_{22}(p-1) = 0$ and $M_{12}(p) M_{22}(p-1, j) N_{21}(j-1) = 0$ for all fixed $k \in [k_0, k_j]$, all $r \in [k_0, k_0-1]$, all $p \in [k_0 + 1, k_1 - 1]$ and all $j \in [k_0 + 1, p - 1]$.

**Theorem 10.** Consider $S$ and $\tilde{S}$ given by (1) and (14), respectively. The pair $\tilde{(S, J)} \subseteq \tilde{(S, J)}$ if $\tilde{N}_1 = \begin{pmatrix} 0 & N_{12}(1) \\ N_{21}(1) & N_{22}(1) \end{pmatrix}$, $\tilde{N}_1 = \begin{pmatrix} 0 & N_{12}(1) \\ N_{21}(1) & N_{22}(1) \end{pmatrix}$, and either

$$
a) \tilde{M}(p) = \begin{pmatrix} 0 & M_{12}(p) \\ M_{21}(p) & M_{22}(p) \end{pmatrix}, \\
N(p) = \begin{pmatrix} 0 & N_{12}(p) \\ N_{21}(p) & N_{22}(p) \end{pmatrix} \text{ or}
$$

$$
b) \tilde{M}(p) = \begin{pmatrix} 0 & M_{12}(p) \\ M_{21}(p) & M_{22}(p) \end{pmatrix}, \\
N(p) = \begin{pmatrix} 0 & N_{12}(p) \\ N_{21}(p) & N_{22}(p) \end{pmatrix}.
$$

hold for all fixed $k \in [k_0, k_j]$ and all $p \in [k_0 + 1, k_1 - 1]$.

**Contractibility.** The idea is to design a control law for $\tilde{S}$ so that it can be contracted and implemented into $S$. Now, we want to determine the conditions under which a control law designed for $\tilde{S}$ can be contracted into $S$ in terms of complementary matrices.

Denote matrices appearing in the contractibility process as follows. The complementary matrix $F(k)$ has the form $F(k) = \begin{pmatrix} F_1(k) \\ F_2(k) \end{pmatrix}$, for $i, j = 1, \ldots, 4$, where $F_1(k), F_2(k), F_3(k)$, and $F_4(k)$ are $m_1 \times n_1, m_2 \times n_2, m_2 \times n_2, m_2 \times n_2$ matrices, respectively. Define $F(k) = \begin{pmatrix} F_1(k) & F_2(k) \\ F_3(k) & F_4(k) \end{pmatrix}$, where $F_1(k)$ and $F_2(k)$ are $m \times n$ and $m_2 \times n_2$ matrices, respectively. Similarly, denote the gain matrix $K(k) = K_4(k)$, for $i, j = 1, 2, 3$, where $K_4(k)$ are $m_1 \times n_1$ matrices, respectively. The gain matrix
$\bar{K}(k)$ for $\bar{S}$ has the form

$$\bar{K}(k) = R\bar{K}(k)U + F(k),$$

where $\bar{K}(k) = T^{-1}_{\sigma}K(k)T_{\sigma}$ and $\bar{F}(k) = T^{-1}_{\sigma}F(k)T_{\sigma}$. So far we do not know the form of the complementary matrix $F(k)$ and the corresponding contractibility conditions. The following theorem solves the problem.

**Theorem 11.** Consider $S$ and $\bar{S}$ given by (1) and (14) satisfying $\bar{S} \supset S$, respectively. A control law $u(k) = -K(k)x(k)$ of $S$ if $F(k) = \begin{pmatrix} 0 & F_{12}(k) & F_{22}(k) \end{pmatrix}$ satisfies

$$F_{12}(k)M_{21}(k - 1) = 0, \quad F_{12}(k)N_{21}(k - 1) = 0,$$

$$\tilde{F}_{12}(k)M_{22}(k - 1, \beta)pM_{21}(p - 1) = 0, \quad \tilde{F}_{12}(k)M_{22}(k - 1, \beta)pM_{21}(p - 1) = 0,$$

for all fixed $k \in [k_0, k_j]$ and all $p \in [k_0 + 1, k - 1]$. 

**Proof.** Suppose $\bar{F}(k) = \begin{pmatrix} F_{12}(k) & F_{22}(k) \end{pmatrix}$. Consider the conditions by Theorem 7. Only the relation $Q\bar{F}(k)\bar{V} = 0$ is defined for $k = k_0$. We obtain $F_{11}(k_0) = 0, Q\bar{F}(k)\bar{V} = 0$. $Q\bar{F}(k)M[k - 1, \beta]\bar{V} = 0$ and $Q\bar{F}(k)N(k - 1) = 0$ give $F_{11}(k_0 + 1) = 0, F_{12}(k_0 + 1)M_{21}(k_0) = 0$ and $F_{12}(k_0 + 1)N_{21}(k_0) = 0$ for $k = k_0 + 1$, respectively. We obtain $F_{11}(k) = 0, F_{12}(k)M_{21}(k - 1) = 0, F_{12}(k)M_{22}(k - 1, \beta)pM_{21}(p - 1) = 0, F_{12}(k)M_{22}(k - 1, \beta)pM_{21}(p - 1) = 0$, for all fixed $k \in [k_0, k_j]$. 

### 3.2 Selection of complementary matrices

The above results are general, i.e. they do not depend on the selection of the matrices $V$ and $R$. Therefore, they can be applied to any expansion-contraction process. Specific transformation matrices $V$ and $R$ must be selected to expand a given problem (1) when considering the control design. We select the following expansion transformation matrices:

$$V = \begin{pmatrix} I_{n_1} & 0 & 0 \\ 0 & I_{n_2} & 0 \\ 0 & 0 & I_{n_3} \end{pmatrix}, \quad R = \begin{pmatrix} I_{m_1} & 0 & 0 \\ 0 & I_{m_2} & 0 \\ 0 & 0 & I_{m_3} \end{pmatrix}.$$  

$x_{12}(k)$ and $y_{12}(k)$ appear in a repeated form in $\bar{x}(k) = \begin{pmatrix} x_{12}(k), x_{22}(k), x_{23}(k), x_{24}(k) \end{pmatrix}^T$ and $\bar{u}(k) = \begin{pmatrix} u_{12}(k), u_{22}(k), u_{23}(k), u_{24}(k) \end{pmatrix}^T$ by using (18), respectively. The change of basis results in

$$T_{\sigma}^{-1} = \begin{pmatrix} I_{m_1} & 0 & 0 \\ 0 & I_{m_2} & 0 \\ 0 & 0 & I_{m_3} \end{pmatrix},$$

$$T_{\sigma}, T_{\sigma}^{-1}$$ have an analogous structure. The following theorems present the structure of the complementary matrices $M(k), N(k), M_{12}(k), M_{22}(k), N_{12}(k), N_{22}(k)$ in the initial bases.

**Theorem 12.** Consider $S$ and $\bar{S}$ given by (1) and (2), respectively. $\bar{S} \supset \bar{S}$ if and only if $M(r)$ has the following structure:

$$M_{12}(r) + M_{22}(r), M_{12}(r) = 0,$$

$$M_{22}(r) = (p)M_{22}(r)(j - 1) = 0,$$

$$N_{12}(r) + N_{22}(r), N_{12}(r) = 0,$$

$$N_{22}(r) = (p)N_{22}(r)(j - 1) = 0,$$

for all fixed $k \in [k_0, k_j]$, all $r \in [k_0, k - 1]$, all $p \in [k_0 + 1, k - 1]$ and all $j \in [k_0 + 1, p - 1]$. The matrix $N(r)$ has the same structure as $M(r)$.

**Proof.** Consider $\bar{M}(r) = T_{\sigma}^{-1}M(r)T_{\sigma}$ given by (15), where $T_{\sigma}$ and $T_{\sigma}^{-1}$ are given by (19). From Proposition 8, $\bar{M}(r) = 0$. The other matrix blocks $\bar{M}(r)$, i.e. $j = 1, 2$ can be identified from Proposition 8. Consequently, we obtain the structure of the complementary matrix $M(r)$ given by (20). An analogous procedure holds for the matrix $N(r)$ when applying Proposition 9. Now, get (21) when imposing the conditions $M_{12}(p)M_{21}(p - 1) = 0, M_{12}(p)M_{22}(p - 1, j)M_{21}(j - 1) = 0, \bar{M}(r)N_{21}(p - 1) = 0 + \bar{M}(p)N_{22}(p - 1, j)N_{21}(j - 1) = 0$ for all fixed $k \in [k_0, k_j]$, all $r \in [k_0, k - 1]$, all $p \in [k_0 + 1, k - 1]$ and all $j \in [k_0 + 1, p - 1]$ given by Propositions 8 and 9. 

**Theorem 13.** Consider $S$ and $\bar{S}$ given by (1) and (2), respectively. $(S, J) \supset (S, J)$ if the matrices $M_{12}(k), M_{22}(k), N_{12}(k), N_{22}(k)$ have the following structure, respectively:

$$\begin{pmatrix} 0 & M_{12} & -M_{12} & 0 \\ -M_{12} & M_{22} & M_{22} & -M_{22} \\ -M_{12} & M_{22} & M_{22} & -M_{22} \\ 0 & -M_{12} & M_{22} & M_{22} \end{pmatrix}.$$
and either
\[
\begin{pmatrix}
0 & M_{q12} & -M_{q2} & 0 \\
- M_{q2} & - M_{q23} & -M_{q3} & -M_{q24} \\
0 & M_{q23} & -M_{q3} & -M_{q24} \\
0 & 0 & M_{q24} & 0 \\
N_{q1} & -N_{q2} & -N_{q3} & 0 \\
- N_{q2} & - N_{q23} & -N_{q3} & -N_{q24} \\
0 & N_{q3} & -N_{q24} & 0 \\
0 & -N_{q23} & -N_{q24} & 0
\end{pmatrix}(k),
\]

and either
\[
\begin{pmatrix}
0 & 0 & 0 & 0 \\
0 & -M_{g1} - M_{g2} & -M_{g3} & -M_{g4} \\
0 & 0 & M_{g3} & M_{g4} \\
0 & 0 & M_{g4} & 0 \\
N_{g1} & 0 & -N_{g2} & 0 \\
-N_{g2} & -N_{g23} & N_{g3} & N_{g24} \\
0 & N_{g3} & -N_{g24} & 0 \\
0 & -N_{g23} & N_{24} & -N_{g24}
\end{pmatrix}(p),
\]

or
\[
\begin{pmatrix}
0 & M_{g1} - M_{g2} & 0 & 0 \\
0 & -M_{g2} - M_{g3} & -M_{g4} & 0 \\
0 & 0 & M_{g4} & 0 \\
0 & 0 & M_{g4} & 0 \\
N_{g1} & 0 & -N_{g2} & 0 \\
-N_{g2} & -N_{g23} & N_{g3} & N_{g24} \\
0 & N_{g3} & -N_{g24} & 0 \\
0 & -N_{g23} & N_{24} & -N_{g24}
\end{pmatrix}(p),
\]

hold for all fixed \( k \in [k_o, k_f] \) and all \( p \in [k_o + 1, k - 1] \).

**Theorem 14.** Consider \( S \) and \( \tilde{S} \) given by (1) and (2) satisfying \( \tilde{S} \subseteq S \), respectively. A control law \( u(k) = -F(k)z(k) \) for \( \tilde{S} \) is contractible to the control law \( u(k) = -K(k)z(k) \) of \( S \) if \( F(k) = 
\[
\begin{pmatrix}
F_{21} & F_{22} & -F_{222} & F_{24} \\
F_{223} & F_{23} & -F_{234} & F_{24} \\
F_{24} & F_{24} & 0 & 0 \\
F_{24} & F_{24} & 0 & 0
\end{pmatrix}(k)
\]

satisfies
\[
\begin{pmatrix}
F_{21} \\
F_{21} \\
F_{21} \\
F_{21}
\end{pmatrix}(k)
\begin{pmatrix}
M_{31} & M_{32} & M_{33} & M_{34} \\
N_{31} & N_{32} & N_{33} & N_{34} \\
M_{34} & M_{34} & 0 & 0 \\
N_{34} & N_{34} & 0 & 0
\end{pmatrix}(k-1) = 0,
\]

for all fixed \( k \in [k_o, k_f] \) and all \( p \in [k_o + 1, k - 1] \).

**Proof.** Consider \( F(k) = T_a^{-1}F(k)T_a \) with \( T_a^{-1}, T_a \) given by (19). \( F_{11}(k) = 0 \) and the other matrix blocks \( F_{ij}(k), i,j = 1,2 \) can be identified from Theorem 11. Thus, we obtain the structure of \( F(k) \). Further, we get (22) by imposing (17). □

**Remark.** Choosing \( F_{21}(k) = 0, (F_{23} + F_{33})(k) = 0 \) and \( F_{42}(k) = 0 \) for all \( k \in [k_o, k_f] \) by Theorem 14, then any control law designed for \( \tilde{S} \) is contractible to \( S \). Moreover, we may identify two important cases from (21) as follows:

\[ a) M_{12}(p) = 0, (M_{23} + M_{23})(p) = 0, M_{24}(p) = 0, \]

\[ b) M_{21}(p - 1) = 0, (M_{22} + M_{23})(p - 1) = 0, \]

for all fixed \( k \in [k_o, k_f] \) and all \( p \in [k_o + 1, k - 1] \).

4. CONCLUSION

The inclusion principle has been specialized for the LQ control design for discrete-time LTV systems. The strategy of generalized selection of complementary matrices has been developed. Explicit conditions on their structure have been proved, including conditions on contractibility of controllers. A systematic procedure for the selection of complementary matrices is included for a particular set of expansion/contraction matrices.
