Abstract

Peru has the largest amount of the tropical glaciers of the world. Nevertheless, 10% of the population lacks water service and 25.5% lacks drainage (sewerage or sanitation). It's also important to notice that Peru is divided into the coast, mountain, and jungle. Being the coast, the region with the least area but the major population. To wit, Lima, a coast department, has 29.7% of the population of the country. To magnify the problem, 72% of wastewater is treated and discharge to the Pacific Ocean. Thus, it isn't difficult to foresee that this situation is unsustainable. Reuse of treated wastewater could be an excellent alternative to help solve this problem. Accordingly, the current study aims: I) to evaluate the physicochemical and biological quality of UNALM constructed wetland effluent (SDG 6) and II) to know the potentialities of the reuse of this effluent for afforestation irrigation (SDG 11 y SDG 15).

Keywords: Constructed wetlands, wastewater reuse, French system, afforestation.

² Universidad Nacional Agraria La Molina, Lima, Peru

INTRODUCTION

In Peru, 10% of the population lacks water service and, 25.5% lacks sewerage service (MVCS, 2017). In addition, more than 70% of the population lives on the coast (Ioris, 2012), where there's a water deficit. The coverage of domestic wastewater in Peru reaches 72% but, if Callao and Lima (capital city) are excluded, the rest of the country only reaches 48% (GWI, 2016). In this framework, is considered to contribute:

SDG 6. Target 6.2

“By 2030, achieve access to adequate and equitable sanitation and hygiene for all and end open defecation, paying special attention to the needs of women and girls and those in vulnerable situations”.

Moreover, it is worth mentioning that in Peru, the prime technologies used for the treatment of domestic wastewater consist of the combination of primary and secondary facultative lagoons (ANA, 2016).

As of 2018, the MVCS (Ministerio de Vivienda Construcción y Saneamiento) issued a regulation that considers to constructed wetlands for wastewater treatment. One of them is the so-called constructed wetlands (CW), technology that simulates the natural processes of pollutant removal; and is characterized by low cost, easy operation and maintenance, and potential for application in decentralized situations (Dotro, Langergraber, Molle, Nivala, Puigagut, Stein & Von Sperling, 2017). Furthermore, aquatic plants and chemical, physical, and biological mechanisms are optimal for treating wastewater (Von Sperling & Chernicharo, 2005). On the other hand, investigations carried out in wetlands built in high Andean areas, showed potentialities of using treated water for afforestation (Rosado, Paredes, Joachin, Morató, & Rosario, 2019).

However, constructed wetlands require pre-treatment to remove solids. Against this background, vertical flow wetlands have been successfully tested to treat raw wastewater, known as the “French System”, and includes two stages: French cell (1st stage) + vertical flow subsurface wetland (2nd stage). Both provide integrated sludge and wastewater treatment in a single system (Molle, Liénard, Boutin, Merlin & Iwema, 2005).

In 2011, an experience with the French System was carried out in a coastal city of 60 inhabitants (Chinc ha-Peru). The results showed that the pollutant removal in the French cell (1st) is more efficient compared to other treatment technologies: septic tank, ABR, Imhoff tank, UASB (Platzer, Hoffmann & Miglio, 2016).

Also, in 2011, 2 pilot plants were built in the facilities of the Universidad Nacional Agraria La Molina -UNALM (Lima-Peru), to promote research work (Pastor, Miglio, Suero, Arias & Morató, 2016). The system consists of 2 lines, and each of them has been dimensioned for 30 PE, which generates a flow of 6 m³d⁻¹ per line. Two types of pre-treatments have been built, an improved septic tank (Baffled Tank or ABR) and a vertical wetland or “French System”.

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER IN SMALL CITIES ON THE PERUVIAN COAST

The research results aimed at optimizing the operation of the French System (León, 2020) are shown in this work and are intended to contribute to SDG 6. Goal 6.3, SDG 11. Goal 11.7 and SDG 15. Goal 15.2.

SDGs 6. Target 6.3

“By 2030, improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally”.

SDGs 11. Target 11.7

“By 2030, provide universal access to safe, inclusive and accessible, green and public spaces, in particular for women and children, older persons and persons with disabilities”.

SDGs 15. Target 15.2

“By 2020, promote the implementation of sustainable management of all types of forests, halt deforestation, restore degraded forests and substantially increase afforestation and reforestation globally”.

METHODS

Location

The research was carried out in the pilot plant for the treatment of domestic wastewater (PTAR) located at the Universidad Nacional Agraria La Molina (UNALM), Lima - Peru.

This pilot plant has three lines. Line one is made up of the French System - FS (French cell + O₂ vertical flow subsurface wetlands).

Work was done on the SF line (Figure 1), that is, on the French cell (1st stage) and the O₂ vertical flow subsurface wetlands (2nd stage).

Figure 1. French System of UNALM. Left: 1st stage (French cell); Right: 2nd stage (vertical flow subsurface wetlands)

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER IN SMALL CITIES ON THE PERUVIAN COAST

The FS is made up of a French cell (1st stage) and two vertical flow subsurface wetlands (2nd stage) (Figure 2). The domestic wastewater that enters the French System (raw water) comes from a domestic sewerage network and passes through a 24.5 mm opening grate that is manually cleaned. The wastewater is diverted to a pumping chamber (CB1) and is pumped from there to the French cell using two submerged pumps (B1 and B2). The French cell has a surface area of 36 m² and is subdivided into two subunits or lines of 18 m² of surface each. The two lines operate alternately to guarantee the rest period in each of the lines after a time of use of 72 h (3 d). Each line is fed by one of the pumps; the wastewater enters through two vertical PVC pipes with a diameter of 76.2 mm per line (from 1.1 to 2.2). To ensure an equitable distribution of the wastewater on the surface of each line, the outlet pipes are surrounded by circular concrete plates.

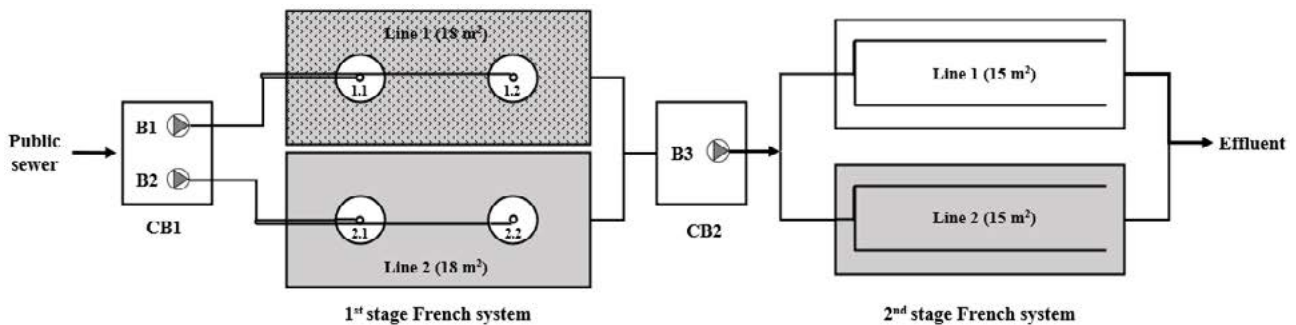

Figure 2. French System Scheme

After passing through the filtering material of the 1st stage, the wastewater is collected through perforated drainage tubes located in the lower part of the filter (diameter of 110 mm), which discharge by gravity to the pumping chamber CB2, from where they are pumped with a submerged pump (B3) to the 2nd stage of the French System. The B3 pump, unlike the other pumps, is controlled by a float to maintain a constant level of water in the pumping chamber. The 2nd stage of the FS has a surface area of 30 m², subdivided into two units or lines of 15 m² of surface each. The treated water enters and is distributed uniformly over the entire surface through pipes, with a diameter of 50.8mm; which are diametrically opposite perforated. After passing through the filter medium, the residual water is captured by drainage tubes (diameter of 101.6 mm) located at the bottom of the cell and finally, the treated water is discharged.

The 1st stage of the French System and one of the subsurface vertical flow wetlands of the 2nd stage have been considered. In Figure 1 the systems studied are shaded in lead colour. The 1st and 2nd stages of the French System are planted with umbrellas (*Cyperus alternifolius*) and vetiver grass (*Chrysopogon zizanioides*), respectively.

The B1 and B2 pumps are controlled by an automated SCADA (Supervisory Control and Data Acquisition) system to ensure a pumping and resting sequence.

The 1st stage has a total filter bed depth of 1m and is divided into three layers of different filter material. From top to bottom, these layers are: 0.6 m gravel Ø 4.75 - 19.0 mm; 0.25 m transition

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER
IN SMALL CITIES ON THE PERUVIAN COAST

layer \varnothing 12.7 mm crushed stone; 0.15 m drainage layer \varnothing 25.4 mm crushed stone. The 2nd stage of the French System has a total filter bed depth of 0.9 m and is divided into 3 layers of different material filters. From top to bottom, these layers are: 0.1 m gravel \varnothing 4.75 - 12.5 mm; 0.6 m transition layer sand \varnothing 9.53 mm; 0.2 m drainage layer \varnothing 4.75 - 12.5 mm (Rotaria del Perú, 2012).

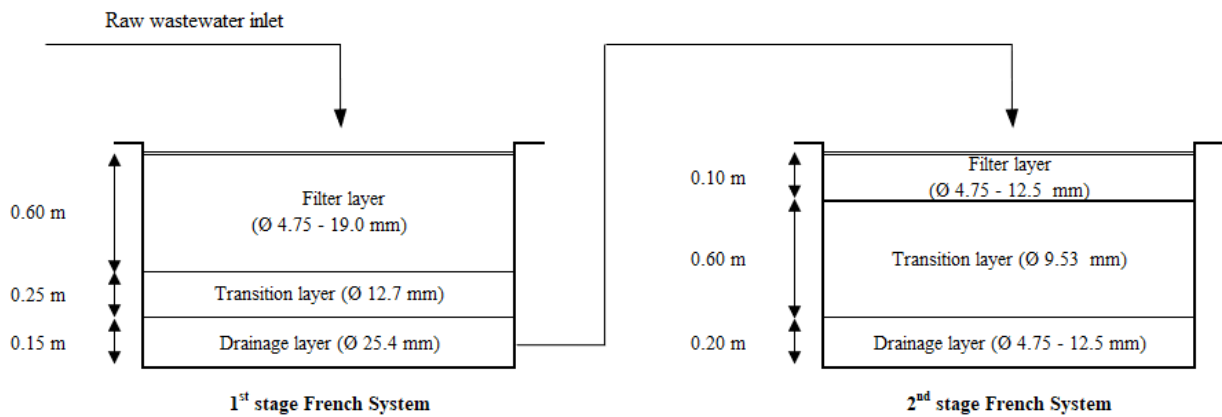

Figure 3. Cross-sectional view of the French System installed at UNALM by Rotaria del Perú (2012)

Operating loads

Four hydraulic load increments were applied to the 1st stage of the SF, with a duration between 6 - 12 weeks each. Table 1 shows the 4 applied load campaigns. In each campaign, B1 and B2 ran alternately for three days each, so that line 1 and line 2 were fed for three days and then rested for the same time.

Throughout the investigation, the system was fed with raw domestic wastewater in hydraulic batches of 6 minutes each. The hydraulic load increased by increasing the number of batches per day, starting 3 batches d⁻¹, and increasing to 6, 8, and 12 batches d⁻¹.

Table 1. Research period for 4 campaigns

Campaign	Station	Date	Research period (week)	Batch duration (min)	Batch number (d ⁻¹)	Pumping time (min d ⁻¹)
I	Spring	Oct - Nov 2017	6	6	3	18
II	Summer	Dic - Jan 2017	8	6	6	36
III	Summer	Feb - May 2017	12	6	8	48
IV	Winter	Jul- Aug 2018	8	6	12	72

Parameters analysed

The temperature (T) and pH parameters were measured in the field. Chemical Oxygen Demand (COD), Biological Oxygen Demand (BOD₅), Total Suspended Solids (SST), Turbidity, Total Nitrogen (N_{Total}), Ammonia Nitrogen (NH₄-N), Nitrate (NO₃-N), and total phosphorus (PO₄-P) were analysed in the Sanitation and Environment laboratory of UNALM. NO₃-N was not analysed in the influent samples, since the raw wastewater was assumed to be anaerobic. Thermotolerant coliforms (CT) and helminth eggs (HH) were analysed in an accredited external laboratory.

RESULTS AND DISCUSSION

Characterization of untreated wastewater

Table 2 shows the characteristics of the concentrations of raw wastewater during the 4 research campaigns (October 2017 to August 2018).

The average pH value of the influent wastewater was 7.5, which is slightly alkaline, and the average temperature was 24.9 °C. The average concentration of the N_{Total} was 55.9 mg L⁻¹, and the NH₄-N represents 70.3% of the N_{Total}, which is 29.7% of the nitrogen that enters the 1st stage was in organic form. The average PO₄-P concentration was 10.1 mg L⁻¹. The average concentrations of COD and BOD₅ (biological oxygen demand) were 699.9 mg L⁻¹ and 344.3 mg L⁻¹ respectively, which turn in a BOD₅ / COD ratio of 0.49 that indicates that any biological treatment can be applied to wastewater (Von Sperling & Chernicharo, 2005). The COD, BOD₅, SST, and Turbidity present high standard deviation, which means the data is dispersed concerning the average, and therefore there is a higher standard error.

Table 2. *Characteristics of the concentrations of raw wastewater during the 4 research campaigns.*

	Unit	Concentration
COD	mg L ⁻¹	699.9 ± 276.6
BOD ₅	mg L ⁻¹	344.3 ± 149.7
SST	mg L ⁻¹	584.9 ± 471.9
N _{Total}	mg L ⁻¹	55.9 ± 14.0
NH ₄ -N	mg L ⁻¹	39.3 ± 8.3
PO ₄ -P	mg L ⁻¹	10.1 ± 2.8
Turbidity	NTU	476.6 ± 239.5
pH	-	7.5 ± 0.5
T	(°C)	24.9 ± 2.4

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER
IN SMALL CITIES ON THE PERUVIAN COAST

Hydraulic loads

The hydraulic load results applied to the 1st and 2nd stage of the French System are shown in Table 3. For practical purposes, the hydraulic load applied in the 1st stage was the average of the two lines; instead, the hydraulic load applied in the 2nd stage was only the one calculated in line 2 (see Figure 2).

The hydraulic loads applied in campaign 3 for the 1st and 2nd stages were 0.329 m d⁻¹ and 0.395 m d⁻¹ respectively. These values are similar to those proposed by Dotro, Langergraber, Molle, Nivala, Puigagut, Stein, and Von Sperling (2017) (maximum design hydraulic loads) related to one of the active lines in the 1st and 2nd stage under temperate conditions (0.37 m d⁻¹).

The small variations in hydraulic load applied in the 1st stage are because the power of the pumps was not controllable. The pumps were operating at maximum capacity during the operation periods. Although the pumps manufactured are similar, they do not generate the same volumetric flow generating different hydraulic loads for each of the lines. Other factors were the pipe connections and valves of the installed system.

Table 3. Hydraulic loads applied to the 1st stage (French cell) and line 2 of the 2nd stage (vertical flow subsurface wetland) of the French System.

Campaign	Unit	1 st stage			2 nd stage
		Line 1	Line 2	Average	Line 2
I	m d ⁻¹	0.125	0.113	0.119	0.143
II	m d ⁻¹	0.254	0.247	0.251	0.301
III	m d ⁻¹	0.338	0.319	0.329	0.395
IV	m d ⁻¹	0.449	0.483	0.466	0.589

Treatment efficiencies

Table 4 show the pollutant removal efficiencies of the 1st and 2nd stages, and the whole system (1st + 2nd stage) during the 4 research campaigns. The removal efficiencies in the 1st stage were > 79.9%, > 83.3%, > 96.0%, > 58.2%, > 53.0%, and > 39.3% for COD, BOD₅, SST, N_{Total}, NH₄-N, and PO₄-P respectively. The results obtained are higher than those registered by Molle, Liénard, Boutin, Merlin, and Iwema (2005) for moderate climates and similar to those registered by Lombard and Molle (2017) for temperate climates regardless of the operating hydraulic load.

The removal efficiencies in the 2nd stage were > 84.5%, > 76.7%, > 79.2%, > 38.1%, > 81.6%, and > 22.5% for COD, BOD₅, SST, N_{Total}, NH₄-N, and PO₄-P, respectively. The results obtained are higher than those recorded by Molle, Liénard, Boutin, Merlin, and Iwema (2005) for moderate climates and lower than those recorded by Gomez (2017) for temperate climates, regardless of the operating hydraulic load.

The removal efficiencies of the whole system (1st + 2nd stage) were > 97.7% in all Research Campaigns for COD, BOD₅, and SST, and NH₄-N > 91.5%, these results are even higher than those

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER
IN SMALL CITIES ON THE PERUVIAN COAST

registered by Molle, Liénard, Boutin, Merlin, and Iwema (2005) for moderate climates and similar to those established by Platzer, Hoffmann, and Miglio (2016) for temperate climates regardless of the operating hydraulic load. Likewise, for the N_{Total} and $PO_4\text{-P}$ they present significant efficiencies in all campaigns $> 76.2\%$, without considering the result of $PO_4\text{-P}$ in campaign 4.

However, during field observations, it was noted that in campaign 4 of research, there were signs of clogging and slower passage of residual water over the filter in the 2 stages of the French System. These indications must be confirmed by working with a longer operating time under the operating loads indicated in each investigation campaign.

Table 4. Efficiency of removal of pollutants from the whole system (1st + 2nd stage) during the 4 research campaigns.

	Campaign	Affluent	Effluent 1 st stage	Effluent 2 nd stage	Efficiency
		mg L ⁻¹	mg L ⁻¹	mg L ⁻¹	1 st + 2 nd stage %

Wastewater reuse in forestry

The Urban forest can be considered a goods solution (Randrup et al., 2020) which has several benefits: regulating urban microclimates, filtering air pollution, providing shade, capturing CO₂, and regulating temperature. Within the framework of SDGs 11, they can help citizens have access to safe, inclusive, and accessible green areas and public spaces for the development of social, cultural, and sports activities. However, as can be seen in Figure 4, in Lima, since 2005, more than 200ha have been reforested each year but from 2015 to 2018 this number has decreased considerably.

Figure 4. Area reforested annually in the city of Lima-Peru. Source: MINAM, 2021.

On the other hand, the urban forest requires “a planned development and maintenance approach” (Schwab, 2009), where water is the key element for its proper functioning. Although reforestation is undoubtedly beneficial, each tree consumes water and in this coastal city water is not an abundant resource. That is why it would be optimal to use treated wastewater for irrigation of afforestation in the city of Lima.

Evaluation of microbiological quality for the reuse of wastewater in forestry

Table 5 shows the microbiological quality parameters for irrigation reuse purposes. The results in the tributary fluctuate between 2×10^8 - 4×10^8 NMP mg L⁻¹ for the CT, and at the same time,

CONSTRUCTED WETLANDS FOR THE TREATMENT OF WASTEWATER
IN SMALL CITIES ON THE PERUVIAN COAST

these are similar to those found by Platzer, Hoffmann, and Miglio (2016) for a similar design of the French system under the same climatic conditions. Likewise, the HH fluctuates between 205 - 2200 N ° L⁻¹.

The high removal of CT in the 1st and 2nd stages of the French System is due to sedimentation and filtration in the first 20 cm of the filter medium (Sleytr, Tietz, Langergraber & Haberl, 2007) and the elimination of HH, possibly due to the porosity of filters (Jimenez, 2007).

Table 5. Characteristics of the concentrations of thermotolerant coliforms (CT) and helminth eggs (HH) in wastewater treated in the SF during 4 campaigns.

Campaign		effluent	Effluent 1 st stage SF	Effluent 2 nd stage SF	WHO regulations Restricted irrigation	WHO regulations Unrestricted irrigation
CT	I	NMP ml ⁻¹	2x10 ⁸	4.5x10 ⁵		
	II	NMP ml ⁻¹	4x10 ⁸	6.7x10 ⁶		
	III	NMP ml ⁻¹	3.4x10 ⁷	3.9x10 ⁶	≤ 1	≤10 ³
	IV	NMP ml ⁻¹	2.8x10 ⁶	1.6x10 ⁶		
HH	I	N° L ⁻¹	2200	0		
	II	N° L ⁻¹	485	0		
	III	N° L ⁻¹	205	0	-	≤ 1
	IV	N° L ⁻¹	113	0		

CONCLUSIONS

The characterization of the physical, chemical, and microbiological properties of the effluent from the “French System” as a whole (1st + 2nd stage), indicates an efficiency superior to 90% of elimination of COD, BOD₅, N_{Total}, P_{Total}.

Regarding the N_{Total}, the values (9.8 ± 2.9 - 11.2 ± 2.1 mg N / L) indicate that the effluent can have an environmental use both for recharging aquifers by localized percolation through the ground and by direct injection (RD 1620/2007 - Catalunya). This indicates that a post-treatment would not be necessary for its use in forest irrigation and that it would not affect the quality of the aquifers.

The microbiological evaluation carried out during 4 campaigns showed values of Thermotolerant Coliforms (1.6 x10⁴ - 7x10³ NMP ml⁻¹) and of Helminth Eggs equal to 0 N ° egg L⁻¹, showing that French System produce AR with optimum quality for use in afforestation irrigation.

MODELING OF WWTP SLUDGE DEHYDRATION IN DRYING BEDS	151
AERATED CONSTRUCTED FLOATING WETLANDS FOR SMALL COMMUNITIES	157
CONSTRUCTED WETLANDS FOR DOMESTIC WASTEWATER TREATMENT: FROM CLASSICAL "FRENCH" SYSTEMS TO OPTIMIZED INTENSIFIED TREATMENT WETLANDS	165
WATER QUALITY ASSESSMENT OF URBAN PONDS AND REMEDIATION PROPOSALS (SMALL WAT21)	171
02. ANAEROBIC TREATMENTS	177
ANAEROBIC TREATMENTS: ADVANCED TECHNOLOGIES FOR WASTEWATER TREATMENT IN SMALL URBAN SETTLEMENTS	179
PERFORMANCE ANALYSIS OF INNOVATIVE UPFLOW ANAEROBIC REACTOR AT THE LAGOS AND LOULÉ WWTP	187
EVALUATION AND MATHEMATICAL MODELING OF A NEW FILTERING DEVICE TO IMPROVE THE EFFICIENCY OF REMOVAL OF CONTAMINANTS IN UASB REACTORS	199
DESCRIPTION AND OPERATION OF THE ANAEROBIC DIGESTION UNIT (ENERGY UNIT) IN THE WATER2RETURN PROTOTYPE	205
OBTAINING FERTILIZERS FROM ANAEROBIC CODIGESTION OF SEWAGE SLUDGE AND WINE VINASSE	211
03. EMERGING POLLUTANTS	219
PRESENCE OF PHARMACEUTICAL RESIDUES IN A NATURAL WASTEWATER TREATMENT SYSTEM AND EVALUATION OF THEIR REMOVAL EFFICIENCY	221
CHARACTERIZATION OF THE MAIN EMERGING POLLUTANTS IN WWTP AFFLUENTS OF SMALL RURAL VILLAGES AND MONITORING OF THEIR REMOVAL PERFORMANCE	227
MICROPLASTICS IN SMALL WASTEWATER TREATMENT PLANTS: A CASE OF STUDY IN SIERRA DE CÁDIZ (SPAIN)	233
HORMONAL RESIDUES IN A NATURAL WASTEWATER TREATMENT SYSTEM FROM GRAN CANARIA (SPAIN): PRESENCE, REMOVAL AND RISK ASSESSMENT	239

04. PHYTO-TREATMENT USING MICROALGAE	247
EVALUATION OF SEWAGE TREATMENT THROUGH MICROALGAE-BACTERIA CONSORTIA IN A RACEWAY PHOTO MEMBRANE BIOREACTOR	249
EXPERIMENTAL OPERATION OF AN ALGAE-BACTERIA MIXOTROPHIC REACTOR FED WITH URBAN WASTEWATER	255
PHOTOSYNTHETIC BACTERIA-BASED MEMBRANE BIOREACTOR AS AN ADVANCED TREATMENT OF A SECONDARY EFFLUENT	263
NEW AGITATION AND SEPARATION TECHNOLOGIES FOR SEMI-INTENSIVE MICROALGAE WASTEWATER TREATMENT	267
URBAN WASTEWATER FROM PRIMARY TREATMENT FOLLOWED BY MICROALGA CULTIVATION FOR CHLORELLAVULGARISBIOMASS PRODUCTION. PH INFLUENCE (SMALLWAT21)	283
TECHNO-ECONOMIC ANALYSIS OF MICROALGAE-BASED WASTEWATER TREATMENT IN SMALL POPULATIONS (SMALLWAT21)	293
MONITORING MICROALGAL BIOMASS GROWTH IN WASTEWATER IN LAB-SCALE EXPERIMENTS	301
URBAN WASTEWATER TREATMENT BY CHLORELLA VULGARIS ON BUBBLE COLUMNS (SMALLWAT21)	309
PHYTO-TREATMENT OF AQUACULTURE EFFLUENTS USING MICROALGAE TECHNOLOGY (SMALLWAT21)	319
ASSESSMENT OF THE TREATABILITY OF A STEEL MILL EFFLUENT USING MICROALGAE BIOTECHNOLOGY	327
05. SEWAGE SLUDGE TREATMENTS	337
SEWAGE SLUDGE: CONVERSION INTO AGRONOMIC BIOSTIMULANTS	339
CONVERSION OF DRYING BEDS INTO MACROPHYTE BEDS TO Dewater SLUDGE AT THE ALCOUTIM WWTP	349
MODELING OF WWTP SLUDGE DEHYDRATION IN DRYING BEDS	357
SOLUTIONS FOR SLUDGE MANAGEMENT IN SMALL AGGLOMERATIONS: DECENTRALISED ANAEROBIC DIGESTION (SMALLWAT21)	363
ECODIGESTION: A CONTROL TOOL FOR ANAEROBIC CO-DIGESTION IN WWTP	367
STUDY OF THE SUITABLE FEED DIET FOR DRY ANAEROBIC CO-DIGESTION BETWEEN SLUDGE FROM A WWTP AND TWO AGRO-INDUSTRIAL WASTES	375
EFFECT OF OPERATING TEMPERATURE ON YIELD AND METHANE PRODUCTION IN THE ANAEROBIC CODIGESTION PROCESS OF SLUDGE: VINASSE: POULTRY MANURE	383

INDEX

CASCADE FLASH (C&F) SYSTEM: THERMAL - PRESSURE SLUDGE PRETREATMENT	385
MODELING OF SEWAGE SLUDGE DEWATERING IN DRYING BEDS, ANGOLA CASE	393
COMPARISON OF THE TECHNICAL EFFICIENCY OF VERMICOMPOSTING WITH RESPECT TO THE MOST WIDELY USED PROCESSES FOR THE STABILIZATION OF SEWAGE SLUDGE IN MEXICO ..	399
06. INNOVATIVE TECHNOLOGIES	413
LOW COST WASTEWATER TREATMENT IN ANAEROBIC PHOTOBIOREACTORS ENRICHED IN PURPLE PHOTOTROPHIC BACTERIA	415
EVALUATION OF SMALL DOSES OF H ₂ O ₂ FOR SOLAR WATER DISINFECTION ENHANCEMENT	421
NOVEL DIRECT ULTRAFILTRATION SYSTEM ASSISTED BY COAGULATION-FLOCCULATION FOR SEWAGE TREATMENT	427
INTEXT PROJECT: HYBRID INTENSIVE-EXTENSIVE RESOURCE RECOVERY FROM WASTEWATER IN SMALL COMMUNITIES	433
DECENTRALISED WASTEWATER TREATMENT IN THE FRAME OF CIRCULAR ECONOMY IN URBAN AND RURAL AREAS IN INDIA: SARASWATI 2.0	439
TWIST: INVOLVING STAKEHOLDERS IN THE INNOVATION PROCESSES AS THE ENGINE OF THE NEW KNOWLEDGE ECONOMY	447
LIFE CYCLE ASSESSMENT OF A WASTEWATER TREATMENT PLANT UNDER THE SCOPE OF CIRCRRURAL 4.0 (SMALLWAT21)	453
CAN PERMEABLE PAVEMENTS ACT AS WATER STORAGE SYSTEMS? EVALUATION OF WATER TREATMENT CAPACITY AND REUSE	461
SOLAR PROCESSES AND OZONE AS ALTERNATIVE TREATMENTS FOR WASTEWATER REUSE IN AGRO-FOOD INDUSTRIES: WATER, CROPS AND RISK ASSESSMENT	467
COMPARISON OF UVC/H ₂ O ₂ AND UVC/S ₂ O ₈ ²⁻ PROCESSES FOR SIMULTANEOUS REMOVAL OF MICROCONTAMINANTS AND BACTERIA IN SIMULATED MUNICIPAL WASTEWATER AT PILOT-SCALE	475
07. INTENSIVE TECHNOLOGIES AND NUTRIENT REMOVAL	483
RISKS IN SUSTAINABLE MANAGEMENT OF WASTEWATER TREATMENT PLANTS OF SMALL VILLAGES ASSOCIATED WITH THE OBJECTIVES OF NUTRIENT CONTENT REDUCTION	485
LIFE PHOENIX: INNOVATIVE COST-EFFECTIVE TREATMENTS FOR REUSING WATER AND NUTRIENTS FOR AGRICULTURAL APPLICATION IN SMALL COMMUNITIES	490
MEDITERRANEAN LIVING LABS FOR NON-CONVENTIONAL WATER REUSE AT LOCAL SCALE: MENAWARA PROJECT	491

INDEX

EC ENVIRONMENTAL TECHNOLOGY VERIFICATION OF RICHWATER® MEMBRANE BIOREACTOR 497

EVALUATION OF EFFECTIVE MICROORGANISMS (EM) IN THE PROCESS OF TREATMENT OF DOMESTIC WASTEWATER IN HIGH-ANDEAN CONDITIONS 503

SIMULATION OF AN ACTIVATED SLUDGE PROCESS USING THE ASM1 AND ASAL1 MODELS: A CASE STUDY 521

THE PROCESSING AND ANALYSIS OF DATA AS AN INNOVATIVE TECHNOLOGY FOR IMPROVING THE EFFICIENCY AND MAINTENANCE OF WASTEWATER PLANTS (SMALLWAT21) 527

EFFECT OF SALINITY ON THE EFFICIENCY OF WASTEWATER TREATMENT OF AN ACTIVATED SLUDGE SYSTEM 537

DESIGN AND IMPLEMENTATION OF A ROTATING BIOLOGICAL CONTACTOR PROTOTYPE AS AN ALTERNATIVE FOR WASTEWATER TREATMENT AT INTERMEDIATE CITIES 543

BIOAUGMENTATION IN WASTEWATER COLLECTION SYSTEMS TO REDUCTION CONTAMINATION LOAD, BIOLOGICAL NUTRIENTS REMOVAL AND ELIMINATION BAD ODORS 548
