TABLE OF CONTENTS

List of figures xvii

CHAPTER 1 INTRODUCTION 1
1.1 Background of the Research Project 1
1.2 Scope and Objectives of the Research Programme 2
1.3 Layout of the Thesis and Overview of the Experimental Programme 3

CHAPTER 2 SOIL USED IN THE INVESTIGATION 5
2.1 Geological Origin of the Material and Mineralogy 5
2.1.1 Origin of the material 5
2.1.2 X-ray diffraction analysis 6
2.1.3 Mineralogy 7
2.2 Classification and Geotechnical Characteristics of Clay Powder and Packings 7
2.2.1 Geotechnical classification tests 7
2.2.1.1 General tests on clay powder and clay packings 7
2.2.1.2 Clay powder and remoulded state characterisation 9
2.2.2 Pore water extraction by squeezing technique. Osmotic suction measurement 11
2.2.2.1 General aspects and experimental procedure 11
2.2.2.2 Experimental results 12
2.3 Static Compaction Tests and Powder Preparation Techniques for the Different Soil Structures used in the Experiments 13
2.3.1 Static compaction tests 13
2.3.1.1 Test procedures and results 13
2.3.1.2 One-dimensional compression results in the lateral stress measuring system cell 15
2.3.2 Powder preparation techniques for the different soil structures 17
2.4 Resonant Column Tests 19
2.5 Mercury Intrusion Porosimetry and SEM Studies for the Different Soil Packings 20
2.5.1 Background of mercury intrusion porosimetry 20
2.5.1.1 Introduction 20
2.5.1.2 Background of Wahburn equation used in MIP 21
2.5.2 MIP equipment and testing procedures. MIP specimen preparation 23
2.5.3 MIP results and interpretation 24
2.5.4 MIP - retention curve relationships 27
2.5.5 MIP-saturated permeability relationships 30
2.5.5.1 General MIP-permeability model 30
2.5.6 SEM technique for direct fabric viewing. Comparisons between porosimetry and microscopy 32
2.5.6.1 Experimental procedure 32
2.5.6.2 Interpretation of SEM results 32
2.6 Swelling-collapse potential of the aggregate packings under applied loads. 33
2.6.1 Testing procedures and results of swelling-collapse experiments 33
2.6.2 Experimental method and results of one-dimensional consolidation tests 34
2.6.2.1 Experimental method 34
2.6.2.2 Experimental results and interpretation 34

CHAPTER 3 EXPERIMENTAL EQUIPMENT AND LAYOUT 61
3.1 General Layout of Testing Equipment 61
3.1.1 Introduction 61
3.1.2 General layout of air and water pressure systems 61
3.1.2.1 Axis translation technique. Operational techniques 61
3.1.2.2 Diaphragm, piston and cell air pressure systems. Water pressure system 64
3.2 Development of Suction Controlled Oedometer Cells 65
3.2.1 Conventional suction controlled oedometer cell 65
3.2.2 Suction and temperature controlled oedometer cell 65
3.2.2.1 Description of the oedometer cell and heating system 65
3.2.2.2 Experimental layout. Auxiliary devices 66
3.2.2.3 Cell modifications to perform swelling pressure tests 67
3.2.3 Lateral stress suction controlled oedometer cell 68
3.2.3.1 Null-type confining ring. Control system and calibration 68
3.2.3.2 Oedometer cell and testing layout. Compaction layout 70
3.2.4 Suction controlled oedometer cells and testing layout calibrations 70
3.2.4.1 Mechanical calibration. Cell deformability and vertical load calibrations 70
3.2.4.2 Temperature calibrations 72
3.2.4.3 Temperature and ageing effects on water permeability of HAEV discs 75
3.2.5 Flushing system and diffused air volume indicators 76
3.2.5.1 Concepts and formulation of air diffusion through saturated ceramic discs 76
3.2.5.2 Experimental measurement of the diffused air 78
3.3 Development of Suction Controlled Isotropic Cells 80
3.3.1 Suction controlled mini isotropic cell 80
3.3.2 Temperature and suction controlled triaxial cell layout. Modifications for isotropic testing 81
3.3.3 Axial displacement transducers 82
3.3.3.1 General characteristics 82
3.3.3.2 Temperature calibrations 83
3.3.4 Radial displacement sensors 83
3.3.4.1 Introduction. Laser-based electro-optical sensors 83
3.3.4.2 Implementation in the triaxial cell 84
3.3.4.3 Calibrations and performance evaluation 85
3.3.4.4 Calibrations for non-isothermal paths. Temperature effects on sensitivity and zero shifts 86
3.3.4.5 Theoretical considerations of refraction effects 87
3.3.4.6 Assessment of errors 89
3.3.5 Forced convection heating system 90
3.3.6 Data acquisition system 91

CHAPTER 4 EXPERIMENTAL PROGRAMME AND PROCEDURES 119
4.1 Experimental Procedure of Soil Suction Imposition under a Temperature Field. Psychrometer calibrations 119
4.1.1 General aspects of soil water potential. Background of application and measurement of soil suction 119
4.1.2 Vapour equilibrium technique 121
4.1.3 Suction imposition test series at different temperatures 123
4.1.4 Psychrometer calibrations and measurements 125
4.2 Testing Programme and Test Paths 126
4.2.1 Test paths and methodology 126
4.2.1.1 Oedometer test paths 126
4.2.1.2 Isotropic test paths 128
4.2.2 Oedometer and isotropic testing programme 129

4.2.2.1 Oedometer testing programme 129
4.2.2.2 Isotropic testing programme 131
4.3 Sample Preparation Techniques 133
4.3.1 Stress paths for sample preparation (oedometer tests) 133
4.3.2 Examination of static compaction techniques for isotropic tests (triaxial equipment) 134
4.4 Testing Procedures 135
4.4.1 Saturation of ceramic discs. Water volume changes 135
4.4.2 Specimen mounting 136
4.4.2.1 Specimen mounting in oedometer cells 136
4.4.2.2 Specimen mounting in triaxial cell 137
4.4.3 Equalisation stages 140
4.4.3.1 Equalisation periods for wetting-drying paths 140
4.4.3.2 Equalisation periods for loading-unloading paths 142
4.5 Test Spurious Problems 145
4.5.1 Ring friction effects 145
4.5.2 Spurious problems with evaporative fluxes 146
4.5.2.1 General aspects. Measured evaporative fluxes 146
4.5.2.2 Theoretical bases of the thermo-hydraulic analysis 147

CHAPTER 5 THERMO-HYDRAULIC EXPERIMENTAL RESULTS 179
5.1 Retention Curves obtained from Vapour Equilibrium, Psychrometer Results and Air Overpressure Techniques 179
5.1.1 Aspects of clay-water system 179
5.1.2 Main wetting and drying curves for different packings at T = 22°C (vapour equilibrium technique) 181
5.1.3 Main wetting and drying curves for different packings at T = 22°C (air overpressure technique) 182
5.1.4 Aspects of soil – water characteristic curves (main wetting and drying paths). Soil - water characteristic curve equations 182
5.1.5 Temperature effects on main wetting paths (vapour equilibrium technique) 185
5.1.6 Aspects of temperature effects on soil water retention 186
5.1.7 Main wetting-drying cycles and first scanning wetting path obtained from suction controlled oedometer tests at different temperatures 188
5.1.7.1 Main wetting paths at different temperatures 188
5.1.7.2 General aspects of main drying and first scanning wetting paths at different temperatures 190
5.2 Water Permeability Determination under Controlled Suction 192
5.2.1 Introduction. Unsaturated flow equations. General aspects 192
5.2.2 General aspects and testing results of partial saturation and porosity effects on water permeability at two different temperatures 196

CHAPTER 6 THERMO-HYDRO-MECHANICAL OEDOMETER RESULTS 227
6.1 Stress and Strain State Variables under Isothermal Conditions used in the Research 227
6.1.1 General aspects of stress state variables 227
6.1.2 General aspects of work conjugate strain variables 230
6.2 Suction Controlled Swell / Shrinkage under Constant Load Results on Low-Porosity Packings 231
6.2.1 Isothermal paths 231
6.2.1.1 General aspects. Main wetting and drying paths 231
6.2.1.2 Reversible features under nearly saturated conditions 237
6.2.1.3 Thermal induced reversible features under nearly saturated conditions (isothermal data) 238

6.2.2 Non-isothermal paths 240
6.3 Suction Controlled Collapse (Swell) / Shrinkage under Constant Load Results on High-Porosity Packings (Isothermal Paths) 242
6.3.1 Main wetting and drying paths 242
6.3.2 Reversible features under nearly saturated conditions 245
6.4 Loading-Unloading Paths under Controlled Suction 246
6.4.1 Results on low-porosity packings 246
6.4.2 Results on high-porosity packings 250
6.5 Suction Controlled Constant Volume Swelling and Shrinkage Pressure Tests 252

CHAPTER 7 THERMO-HYDRO-MECHANICAL ISOTROPIC RESULTS 319
7.1 Isothermal Suction Controlled Paths 319
7.1.1 Suction controlled swell or collapse / shrinkage under constant net mean stress 319
7.1.1.1 Testing results on the low-porosity packing 319
7.1.1.2 Testing results on the high-porosity packing 320
7.1.1.3 Compressibility aspects using DDL theory under nearly saturated conditions 322
7.1.2 Loading-unloading paths under constant suction 325
7.2 Non-Isothermal Suction Controlled Paths on the High-Porosity Packing 326
7.2.1 General aspects and pore pressure build-up under quasi-undrained heating 326
7.2.1.1 General aspects and testing results 326
7.2.1.2 Pore pressure generation under quasi-undrained conditions 329
7.2.2 Thermo-mechanical behaviour under quasi-undrained conditions 331
7.2.3 Thermo-mechanical behaviour under drained conditions 332

CHAPTER 8 SUMMARY, CONCLUSIONS AND FUTURE RESEARCH WORK 375
8.1 Summary and Conclusions 375
8.1.1 Characterisation of the material 375
8.1.2 Experimental equipment, programme and procedures 375
8.1.3 Thermo-hydro-mechanical results 377
8.1.3.1 General aspects. Temperature effects on hydraulic properties 377
8.1.3.2 Thermo-hydro-mechanical aspects: oedometer tests 378
8.1.3.3 Thermo-hydro-mechanical aspects: isotropic tests 379
8.2 Future Research Work 380

REFERENCES 383

APPENDIX A AGGREGATE SWELLING IN A WETTING PATH: ESEM IMAGES 403
A.1 Equipment, sample preparation and wetting path 403
A.2 Volume change evolution 403
